

Let  $X_1, X_2, \dots, X_n$  be a random sample from the normal distribution with mean  $\mu$  and known variance  $\sigma^2$ .

Consider testing the simple versus simple hypotheses

$$H_0 : \mu = \mu_0 \quad H_1 : \mu = \mu_1$$

where  $\mu_0$  and  $\mu_1$  are fixed and known.

Suppose that  $\mu_0 < \mu_1$ .

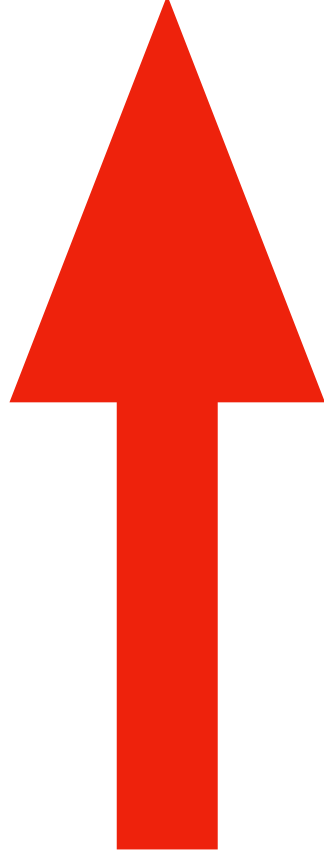

## The Test:

$$H_0 : \mu = \mu_0$$

$$H_1 : \mu = \mu_1$$

$$\mu_0 < \mu_1$$

Reject  $H_0$ , in favor of  $H_1$  if

$$\bar{X} > \mu_0 + z_{\alpha} \frac{\sigma}{\sqrt{n}}$$

came from the  
probability of  
making a Type I error

## The Test:

$$H_0 : \mu = \mu_0$$

$$H_1 : \mu = \mu_1$$

$$\mu_0 < \mu_1$$

Reject  $H_0$ , in favor of  $H_1$  if

$$\bar{X} > \mu_0 + z_{\alpha} \frac{\sigma}{\sqrt{n}}$$

## Question:

What about the Type II error?

# Type II Error

$$H_0 : \mu = \mu_0$$

$$H_1 : \mu = \mu_1$$

$$\mu_0 < \mu_1$$

## Your Decision

fail to reject  $H_0$     reject  $H_0$

$H_0$  true

Type I error

$H_0$  false

Type II error

## Type II Error

$$H_0 : \mu = \mu_0$$

$$H_1 : \mu = \mu_1$$

$$\mu_0 < \mu_1$$

- It is locked in!

$$\beta = P(\text{Type II Error})$$

$$= P(\text{Fail to Reject } H_0 \text{ when false})$$

$$= P\left(\bar{X} \leq \mu_0 + z_{\alpha} \frac{\sigma}{\sqrt{n}} \text{ when } \mu = \mu_1\right)$$

$$= P\left(\bar{X} \leq \mu_0 + z_{\alpha} \frac{\sigma}{\sqrt{n}}; \mu_1\right)$$

# Type II Error

- It is locked in!

$$H_0 : \mu = \mu_0$$

$$H_1 : \mu = \mu_1$$

$$\mu_0 < \mu_1$$

$$\beta = P \left( \bar{X} \leq \mu_0 + z_\alpha \frac{\sigma}{\sqrt{n}} ; \mu_1 \right)$$

$$\bar{X} \sim N(\mu_1, \sigma^2/n)$$

$$= P \left( \frac{\bar{X} - \mu_1}{\sigma/\sqrt{n}} \leq \frac{\mu_0 + z_\alpha \frac{\sigma}{\sqrt{n}} - \mu_1}{\sigma/\sqrt{n}} ; \mu_1 \right)$$

# Type II Error

- It is locked in!

$$H_0 : \mu = \mu_0$$

$$H_1 : \mu = \mu_1$$

$$\mu_0 < \mu_1$$

$$\beta = P \left( \frac{\bar{X} - \mu_1}{\sigma/\sqrt{n}} \leq \frac{\mu_0 + z_{\alpha} \frac{\sigma}{\sqrt{n}} - \mu_1}{\sigma/\sqrt{n}} ; \mu_1 \right)$$

$$= P \left( Z \leq \frac{\mu_0 + z_{\alpha} \frac{\sigma}{\sqrt{n}} - \mu_1}{\sigma/\sqrt{n}} \right)$$

# Type II Error

- It is locked in!

$$H_0 : \mu = \mu_0$$

$$H_1 : \mu = \mu_1$$

$$\mu_0 < \mu_1$$

$$\beta = P \left( Z \leq \underbrace{\frac{\mu_0 + z_\alpha \frac{\sigma}{\sqrt{n}} - \mu_1}{\sigma/\sqrt{n}}} \right)$$

This is a fixed number, so  
compute the probability and  
that's your  $\beta$ !

## Type II Error

- It is locked in!

$$H_0 : \mu = \mu_0$$

$$H_1 : \mu = \mu_1$$

$$\mu_0 < \mu_1$$

$$\beta = P \left( Z \leq \frac{\mu_0 + z_\alpha \frac{\sigma}{\sqrt{n}} - \mu_1}{\sigma/\sqrt{n}} \right)$$

We could create the entire test starting from the “ $\beta$  point of view” and then  $\alpha$  would be locked in.

## Type II Error

- It is locked in!

$$H_0 : \mu = \mu_0$$

$$H_1 : \mu = \mu_1$$

$$\mu_0 < \mu_1$$

$$\beta = P \left( Z \leq \frac{\mu_0 + z_{\alpha} \frac{\sigma}{\sqrt{n}} - \mu_1}{\sigma / \sqrt{n}} \right)$$

If we want to set both  $\alpha$  and  $\beta$  we would have to free up the sample size as another unknown. (c and n)

# Type II Error

## Your Decision

fail to reject  $H_0$       reject  $H_0$

$H_0$ true		Type I error
$H_0$ false	Type II error	

Note:  $\beta \neq 1 - \alpha$

# Composite vs Composite

$$X_1, X_2, \dots, X_n \sim N(\mu, \sigma^2), \quad \sigma^2 \text{ known}$$

$$H_0 : \mu \leq \mu_0 \quad \text{vs} \quad H_1 : \mu > \mu_0$$

## Step One:

$$H_0 : \mu \leq \mu_0$$

$$H_1 : \mu > \mu_0$$

Choose an estimator for  $\mu$ .

$$\hat{\mu} = \bar{X}$$

---

## Step Two:

Give the “form” of the test.

Reject  $H_0$ , in favor of  $H_1$  if  $\bar{X} > c$ ,  
where  $c$  is to be determined.

### Step Three:

$$H_0 : \mu \leq \mu_0$$

$$H_1 : \mu > \mu_0$$

Find c.

$$\alpha = P(\text{Type I Error})$$

$$= P(\text{Reject } H_0 \text{ when true})$$

$$= P(\bar{X} > c \text{ when } \mu \leq \mu_0)$$

= ?

The definitions we have used for  $\alpha$  and  $\beta$  are for simple hypotheses only.

# Definitions:

- The **level of significance** or “**size**” of a test is denoted by  $\alpha$  and is defined by

$$\alpha = \max P(\text{Type I Error})$$

$$= \max_{\mu \in H_0} P(\text{Reject } H_0; \mu)$$

$$\beta = \max P(\text{Type II Error})$$

$$= \max_{\mu \in H_1} P(\text{Fail to Reject } H_0; \mu)$$

# Definitions:

- $1 - \beta$  is known as the  
**power of the test**

$$1 - \beta = 1 - \max_{\mu \in H_1} P(\text{Fail to Reject } H_0; \mu)$$

$$= \min_{\mu \in H_1} (1 - P(\text{Fail to Reject } H_0; \mu))$$

$$= \min_{\mu \in H_1} P(\text{Reject } H_0; \mu)$$

High power  
is good!
